# Command Reference: ReadHydroBase()

## Read time series from a HydroBase database

Version 10.12.00, 2012-09-28

The `ReadHydroBase()` command reads one or more time series from the HydroBase database (see the **HydroBase Datastore Appendix**). It is designed to utilize query criteria to process large numbers of time series, for example for a specific water district and data type.

The **Data type**, **Data interval**, and **Where** command parameters and input fields are similar to those from the main TSTool interface. However, whereas the main TSTool interface first requires a query to find the matching time series list and then an interactive select for specific time series identifiers, the `ReadHydroBase()` command reads the time series list and the corresponding data for the time series. This can greatly shorten command files and simplify command logic, especially when processing many time series.

The command supports the old-style input name selection (which corresponds to selecting HydroBase via the TSTool login dialog) and the new-style datastore convention (which corresponds to datastore configuration files). In the future, support for the input name may be phased out; however, this will require resolving how the HydroBase selection dialog is migrated to support datastores. Consequently, both approaches are currently supported during the transition.

Data for the location (station, structure, well, etc.) and time series metadata, as shown in the main TSTool interface, are set as time series properties. For example, the `latdecdeg` and `longdecdeg` values from the HydroBase `vw_CDSS_StationMeasType` view are available as time series properties of the same name. These properties can be transferred to a table with the `CopyTimeSeriesPropertiesToTable()` command and processed further with other table commands.

Time series corresponding to diversion records, which also include observations for reservoirs and wells, are handled as follows:

1. Daily diversion (`DivTotal` and `DivClass`) and reservoir release (`RelTotal` and `RelClass`) time series have their values automatically carried forward to fill data within irrigation years (November to October). HydroBase only stores full months of daily diversion record data when non-zero observations or non-zero filled values occur in a month. Therefore, this filling action should only provide additional zero values in an irrigation year where a diversion or release was recorded. Irrigation years with no observations remain as missing after the read.
2. Daily, monthly, and yearly diversion and reservoir release time series optionally can be filled by the `ReadHydroBase()` command using diversion comments, which indicate when irrigation years should be treated as missing. See the `FillUsingDivComments` parameter below. Note that diversion comments should not conflict with more detailed records and provide additional information. The separate `FillUsingDivComments()` command also is available for filling but may be phased out in the future.
3. It also may be appropriate to use infrequent data types (`IDivTotal`, `IDivClass`, `IRelTotal`, and `IRelClass`) to supply data; however, because such values typically are annual values, additional decisions must be made for how to distribute the values to monthly and daily time series. These data, if available, are not automatically folded into the diversion records by TSTool.

- See the `FillHistMonthAverage()`, `FillPattern()`, and other commands, which can be used to fill (estimate) values in data gaps after the initial time series are read.

The following dialog is used to edit the command and illustrates the syntax for the command. Two options are available for matching time series, based on historical software requirements. The following example illustrates how to read a single time series by specifying the time series identifier. This approach is essentially equivalent to using the `ReadTimeSeries()` command but offers HydroBase-specific parameters such as `FillUsingDivComments`, which are not available in the more general `ReadTimeSeries()` command.

**Edit ReadHydroBase Command**

Read 1+ time series from a HydroBase database, using options from the parameter groups below.

**The datastore design is being phased in and the legacy input name parameter will be phased out in the future.**

Refer to the HydroBase documentation for information about data types.

Specifying the period will limit data that are available for later commands but can increase performance.

Specify database to read (datastore name will take precedence if specified)

Input name:  Optional - HydroBase connection name (default=HydroBase if no datastore specified).

Datastore:  Optional - HydroBase datastore to read (phasing in datastores).

Data type:  Required - data type for time series

Data interval:  Required - data interval (time step) for time series.

Indicate how to match time series in HydroBase

Match Single Time Series Match 1+ Time Series

Location:  For example, station ID or structure WDID.

Data source:  For example: USGS, DWR.

TSID (full):  Created from above parameters.

Alias to assign:  =>  Optional - use %L for location, etc. (default=no alias).

Input start:  Optional - overrides the global input start.

Input end:  Optional - overrides the global input end.

Specify how to handle diversion comments (only for diversion records)

Fill using diversion comments: ☐ Optional - whether to use diversion comments to fill more zero values (default=False).

Fill using diversion comments flag:  Optional - string to flag filled diversion comment values.

If missing:  Optional - how to handle missing time series (blank=Warn).

Command:

Cancel OK

ReadHydroBase\_TSID

**ReadHydroBase() Command Editor to Read a Single Time Series**

The following figure illustrates how to query multiple time series.

**Edit ReadHydroBase Command**

Read 1+ time series from a HydroBase database, using options from the parameter groups below.

**The datastore design is being phased in and the legacy input name parameter will be phased out in the future.**

Refer to the HydroBase documentation for information about data types.

Specifying the period will limit data that are available for later commands but can increase performance.

Specify database to read (datastore name will take precedence if specified)

Input name:  Optional - HydroBase connection name (default=HydroBase if no datastore specified).

Datastore:  Optional - HydroBase datastore to read (phasing in datastores).

Data type:  Required - data type for time series

Data interval:  Required - data interval (time step) for time series.

Indicate how to match time series in HydroBase

Match Single Time Series Match 1+ Time Series

Use filters ("where" clauses) to limit result size and increase performance. Filters are AND'ed.

Where:	<input type="text" value="County Name"/>	Matches	<input type="text" value="OTERO, CO"/>
Where:	<input type="text" value="Station Name"/>	Starts with	<input type="text" value="TIMPAS"/>
Where:	<input type="text"/>	Matches	<input type="text"/>

Alias to assign:  =>  Optional - use %L for location, etc. (default=no alias).

Input start:  Optional - overrides the global input start.

Input end:  Optional - overrides the global input end.

Specify how to handle diversion comments (only for diversion records)

Fill using diversion comments:  Optional - whether to use diversion comments to fill more zero values (default=False).

Fill using diversion comments flag:  Optional - string to flag filled diversion comment values.

If missing:  Optional - how to handle missing time series (blank=Warn).

Command:

```
ReadHydroBase (DataType="Streamflow", Interval="Month", Where1="County
Name; Matches; OTERO", Where2="Station Name; Starts
with; TIMPAS", Alias="%L-%T-%I")
```

Cancel OK

ReadHydroBase\_Multiple

### ReadHydroBase() Command Editor to Read Multiple Time Series

The command syntax is as follows:

```
ReadHydroBase (Parameter=Value, ...)
```

The following older command syntax is updated to the above syntax when a command file is read:

```
TS Alias = ReadHydroBase (Parameter=Value, ...)
```

## Command Parameters

Parameter	Description	Default
InputName	The HydroBase database connection input name to use for the database connection, as initialized by the <code>OpenHydroBase()</code> command or the HydroBase login dialog shown when TSTool starts. When using this approach the TSID will end in <code>~HydroBase~InputName</code> . The input name approach for specifying a HydroBase database connection may be phased out in the future in favor of the datastore approach.	Use the default HydroBase connection.
DataStore	The HydroBase datastore name to use for the database connection, as per datastore configuration files (see <b>HydroBase Datastore</b> appendix). When using this approach the TSID will end in <code>~DataStore</code> . The datastore approach is being phased in as a more flexible design. Configuring a datastore with name HydroBase will take precedence over <code>InputName=HydroBase</code> .	Use the default (legacy <code>InputName</code> ) HydroBase connection, if available.
DataType	The data type to be queried, as documented in the <b>HydroBase Datastore</b> appendix.	None – must be specified.
Interval	The data interval for the time series, as documented in the <b>HydroBase Datastore</b> appendix (e.g. Day, Month, Year), consistent with the <code>DataType</code> selection.	None – must be specified.
TSID	When reading a single time series, the time series identifier to read. If specified, this parameter will override the <code>WhereN</code> parameters.	Use <code>WhereN</code> parameters to read multiple time series.
WhereN	When reading 1+ time series, the “where” clauses to be applied. The filters match the values in the <b>Where</b> fields in the command editor dialog and the TSTool main interface. The parameters should be named <code>Where1</code> , <code>Where2</code> , etc., with a gap resulting in the remaining items being ignored. The format of each value is:  “Item;Operator;Value”  Where <code>Item</code> indicates a data field to be filtered on, <code>Operator</code> is the type of constraint, and <code>Value</code> is the value to be checked when querying.	If not specified, the query will not be limited and very large numbers of time series may be queried.
Alias	The alias to assign to the time series, as a literal string or using the special formatting characters listed by the command editor. The alias is a short identifier used by other commands to locate time series for processing, as an alternative to the time series identifier (TSID).	None – must be specified.
InputStart	Start of the period to query, specified as a date/time with a precision that matches the requested data interval.	Read all available data.
InputEnd	End of the period to query, specified as a date/time with a precision that matches the requested data interval.	Read all available data.
FillUsing DivComments	Indicate whether to fill diversion and reservoir release time series using diversion comments.	False
FillUsing DivComments Flag	If specified as a single character, data flags will be enabled for the time series and each filled value will be tagged with the specified character. The flag can then be used later to label graphs, etc. The flag will be appended to existing flags if necessary.	No flag is assigned.

Parameter	Description	Default
IfMissing	Indicate the action to be taken if the requested time series is missing, one of: <ul style="list-style-type: none"><li>Ignore – ignore the time series (do not warn and the time series will not be available)</li><li>Warn – generate a failure for the command</li></ul>	Warn

A sample command file is as follows (read all reservoir releases to structure 0300905):

```
ReadHydroBase(DataType="DivClass",Interval="Day",
  Where1="District;Equals;3",
  Where2="Structure ID;Equals;905",Where3="SFUT;Contains;s:2")
```
