

Command Reference: WriteSHEF()

Write time series to a SHEF format file

Version 09.03.04, 2009-04-23

The `WriteSHEF()` command write time series to a Standard Hydrologic Exchange Format (SHEF) .A record format file. See the **SHEF Input Type** appendix for more information about the file format. The SHEF physical element (PE) codes are similar to time series data type codes. The PE code is looked up based on data type information that is available for the execution environment. Currently there is no default PE information on Windows; however, this information is available on Linux when working with National Weather Service River Forecast System files (the SHEF data types are read using NWSRFS app default configuration information). The PE code can be supplied using the `DataTypePELookup` parameter.

This command has primarily been developed to handle hourly data and additional enhancements may be needed for other intervals and data types.

The following dialog is used to edit the command and illustrates the syntax of the command.

Edit WriteSHEF() Command

Write time series to a Standard Hydrologic Exchange Format (SHEF) file - refer to SHEF documentation for data format and nomenclature details.
It is recommended that the file name be relative to the working directory.
The working directory is: C:\Develop\TSTool_SourceBuild\TSTool\test\regression\commands\general\WriteSHEF
The time series to process are indicated using the TS list.
The SHEF physical element (PE) code will normally be determined from the operational environment; however, specify the data type to PE lookup information if necessary.
The observation time, if specified, will be used for all data - specify as an integer or include the character prefix (e.g., DH1200).
The creation time, if specified, will be used for all data - specify as an integer or include the character prefix (e.g., CD20091231).
The duration, if specified, will be used for all data - specify as an integer or include the character prefix (e.g., DVH06).

TS list: Optional - indicates the time series to process (default=AllTS).

TSID (for TSList=AllMatchingTSID):

SHEF file to write:

Append to output?: ☐ Optional - append to command file? (default=False).

DataType,PE;DataType,PE;...:

Output start: Optional - default is all data or global output start.

Output end: Optional - default is all data or global output end.

Time zone: Optional - time zone for output (default=from time series or Z).

Observation time: Optional - observation time (default=from data).

Creation date: Optional - creation date (default=not used).

Duration: Optional - duration (default=determined from time series if irregular).

Output precision: Optional - digits after decimal (default=from units, or 2).

Command:

WriteSHEF

WriteSHEF() Command Editor

The command syntax is as follows:

```
WriteSHEF (Parameter=Value,...)
```

Command Parameters

Parameter	Description	Default
TSList	Indicates the list of time series to be processed, one of: <ul style="list-style-type: none"> AllMatchingTSID – all time series that match the TSID (single TSID or TSID with wildcards) will be processed. AllTS – all time series before the command. FirstMatchingTSID – the first time series that matches the TSID (single TSID or TSID with wildcards) will be processed. LastMatchingTSID – the last time series that matches the TSID (single TSID or TSID with wildcards) will be processed. SelectedTS – the time series are those selected with the SelectTimeSeries() command. 	AllTS
TSID	The time series identifier or alias for the time series to be processed, using the * wildcard character to match multiple time series.	Required if TSList=*TSID
OutputFile	The SHEF output file. The path to the file can be absolute or relative to the working directory (command file location).	None – must be specified.
Append	Indicate whether the output should be appended to the file.	False – create the file.
DataTypePELookup	Pairs of data type and SHEF physical element (PE) codes. The pairs should be separated by semicolons and the data type/PE strings by commas. For example, the data values for instantaneous streamflow and air temperature might be: QIN,QI;TAIN,TA	Use information determined for operational environment, if available.
OutputStart	The date/time for the start of the output.	Use the global output period.
OutputEnd	The date/time for the end of the output.	Use the global output period.
TimeZone	The time zone to be used for all SHEF records.	Z (Zulu time).
ObservationTime	Observation time to use for all SHEF records. Specify as a full string (e.g., DH1200) or an integer (e.g., 1200), in which case the prefix will be determined based on data. For example, use this parameter to specify the observation time for	Time corresponding to time series data values.

Parameter	Description	Default
	daily data .	
CreationDate	The creation date to use for all SHEF records. Specify as a full string (e.g., DC20010131) or an integer (e.g., 20010131), in which case the prefix automatically will be added.	Not used in output.
Duration	The duration code to use for all SHEF records. Specify as a literal string (e.g., DVH06).	Determined automatically from irregular time series, not used for regular interval time series.
Precision	Number of digits after the decimal to use for output.	Determine from the time series data units, or use 2 by default.

A sample command file to write data from a streamflow forecast system is as follows:

```
WriteSHEF(TSList=AllTS,DataTypePELookup="QIN,QI;TAIN,TA",  
OutputFile="Results\Test_WriteSHEF_DataTypePELookup_out.shf")
```
