
Command Reference: ReadColoradoIPP()

Read time series from a Colorado IPP (Basin Needs DSS) database

Version 9.06.04, 2010-05-23

The `ReadColoradoIPP()` command reads one or more time series from the Colorado IPP database (see the **ColoradoIPP Input Type Appendix**). It provides query criteria to process large numbers of time series in order to streamline computation of demand, supply, and water supply gap.

The following dialog is used to edit the command and illustrates the syntax for the command. **Where** criteria should be specified in sequential order without intervening blank selections. A **Subject** selection is required and changing this selection will refresh the choices in other lists; however, choices will not otherwise refresh based on a combination of the previous choices.

Edit ReadColoradoIPP Command

Read one or more time series from the State of Colorado's IPP database.
Constrain the query by specifying time series metadata to match.
Refer to the Colorado IPP Database Input Type documentation for possible values.
If not specified, the period defaults to the input period from SetInputPeriod().

Where: Subject Matches County
Where: Data Source Matches CO DOLA
Where: Matches
Where: Matches
Where: Matches
Where: Matches
Where: Matches
Where: Matches

Input start: Optional - YYYY, override the global input start.
Input end: Optional - YYYY, override the global input end.
Alias to assign: Insert: -- Select Specifier -- Optional - use %L for location, etc. (default=no alias).

Command: ReadColoradoIPP (Where1="Subject;Matches;County", Where2="Data Source;Matches;CO DOLA")

Cancel OK

ReadColoradoIPP

ReadColoradoIPP() Command Editor

The command syntax is as follows:

```
ReadColoradoIPP (Parameter=Value, ...)
```

Command Parameters

Parameter	Description	Default
WhereN	<p>The “where” clauses to be applied when querying data, which match the values in the Where fields in the TSTool main interface. The parameters should be specified as Where1, Where2, etc., with no intervening gaps in numbering. All clauses are joined as “and” and are therefore cumulative in limiting the query. The format of each parameter value is:</p> <p>“Item;Operator;Value”</p> <p>Where Item indicates a data field to be filtered on, Operator is the type of constraint, and Value is the value to be checked when querying.</p>	If not specified, the query will not be limited and very large numbers of time series may result from the query.
InputStart	Start of the period to query, specified as a 4-digit year.	Read all available data.
InputEnd	End of the period to query, specified as a 4-digit year.	Read all available data.
Alias	Indicate an alias to assign to time series, which can result in shorter identifiers for time series when referenced with other commands.	No alias is assigned.
