Appendix: Spatial Data Format – ESRI Shapefile

Overview

ESRI Shapefiles are a relatively simple format for spatial data, consisting of a file containing shape information (.shp), a file containing attribute data (.dbf), and an index file (.shx). The GeoView package currently supports the following shapefile shape types:

- Point (shape type 1)
- Multi-point (shape type 8)
- Arc/Line (shape type 3)
- Polygon type (shape type 5)
- Null shape (shape type 0)

Support for additional shape types may be added in the future, consistent with the shapefile specifications.
