# Command Reference: CloseExcelWorkbook()
Close a Microsoft Excel workbook file
Version 11.03.03, 2015-06-10

The `CloseExcelWorkbook()` command closes a Microsoft Excel workbook file that has been opened with a previous command and kept open by use of the `KeepOpen=True` command parameter. Consequently, using a `CloseExcelWorkbook()` command after other Excel commands ensures that the file is closed.

The following figures illustrate the dialog used to edit the command and the syntax for the command.

CloseExcelWorkbook

CloseExcelWorkbook() Command Editor

The command syntax is as follows:

```
CloseExcelWorkbook(Parameter=Value,…)
```

Command Parameters

Parameter	Description	Default
OutputFile	The name of the Excel workbook file (*.xls or *.xlsx) to close, as an absolute path or relative to the command file location. No action is performed if the open file is not found. Can be specified using processor `${Property}`.	None – must be specified.
